World War I marked a pivotal shift in the geopolitical importance of oil, as it became a critical resource for modern warfare and a key factor in the war's strategic decisions. Prior to the war, coal had been the dominant energy source for military and industrial powers, but the development of oil-powered machines, such as tanks, airplanes, and warships, changed the dynamics of warfare. The British Navy, under Winston Churchill's leadership, had already begun transitioning its fleet from coal to oil, recognizing the immense advantages in speed and efficiency. This shift heightened the strategic value of oil-rich regions, especially in the Middle East, and set the stage for future conflicts over oil resources. As the war progressed, the relentless demand for oil led to significant international efforts to secure and control oil supplies. Both the Allied and Central Powers recognized that their military capabilities were heavily dependent on this resource. The Allies, particularly Britain and France, sought to secure access to oil from Persia (modern-day Iran) and Mesopotamia (modern-day Iraq), while Germany struggled with oil shortages, which ultimately hampered its military operations. The importance of oil became so **pronounced** that it influenced territorial claims and post-war agreements, as seen in the secret Sykes-Picot Agreement, which aimed to divide Ottoman lands, particularly the oil-rich areas, between Britain and France. In this way, World War I marked the beginning of oil's central role in international politics, a trend that would continue to shape global conflicts throughout the 20th century.

**1. What can be learnt about the role of coal before World War I?**

- A) Coal was more efficient than oil for powering machines.
- B) Coal was primarily used for civilian purposes and not for military operations.
- C) Coal served as the primary energy source for military powers.
- D) Coal was only important for land-based military forces.
- E) Coal supplies were easily depleted due to overuse in warships.

**2. Based on the text, one can infer that ----.**

- A) Tanks played a more decisive role than airplanes in the war.
- B) The dynamics of warfare were subject to change due in part to the development of warships.
- C) Coal became a critical resource for modern warfare during WW I.
- D) The British Navy was quite late when it began transitioning its fleet from coal to oil.
- E) If it had not been for Winston Churchill's leadership, the British Navy would have transitioned its fleet from coal to oil earlier.

**3. Based on the text, we can infer that ----.**

- A) It was Germany that had to deal with oil shortages and whose military operation were severely hampered.
- B) Britain and France both aimed to secure access to oil from modern-day Iran and modern-day Iraq.
- C) It was rich coal reserves that determined the strategic value of regions, especially in the Middle East.
- D) The unrelenting need for oil led to significant international consensus to secure and share oil supplies equally.
- E) If it had not been for Winston Churchill's leadership, there would be no conflicts over oil resources.

**4. Based on the text, we can infer that ----.**

- A) If Germany had not struggled with oil shortages, which ultimately hampered its military operations, the Ottoman lands would not have been shared between Britain and France.
- B) Britain and France agreed to share oil from modern-day Iran and modern-day Iraq with the third parties in the secret Sykes-Picot Agreement.
- C) World War I marked the beginning of coal's central role in international politics, and led to secret agreements among the most powerful states of the time.
- D) There were agreements that were signed between two states and kept secret from third parties for the sake of getting a larger share from oil reserves in the Middle East.
- E) Oil crisis lasted shorter than anticipated but it is still a trend that continues to shape global conflicts throughout the 21<sup>st</sup> century.
