freedom / the more

17-21: For these questions, choose the best word or expression to fill the spaces in the passage.

Family is the basic unit of a society and the prevalence of nuclear as well as extended family forms in societies (17) --- a whole, or within segments of these societies is nothing new. A controversy, though, has long been prominent in the sociological literature on how to define these concepts. The far-reaching effects of technological development, particularly that of industrialisation, (18) ---- family life make it harder to define them. These issues could be clarified to some extent at least (19) ---- a meaningful and valid definition of the concepts of nuclear and extended family, and of concepts referring to intervening family forms between these two poles. could be agreed upon. Only then, we (20) ---- a more accurate basis for describing, classifying, and determining the relative frequency of a particular family type in a society regardless of its technological development. We might also have the chance to (21) ---- futile discussions stemming from definitions of concepts rather than actual facts of family life.

17.

22-26: For these questions, choose the best word or expression to fill the spaces in the passage.

Current research is focused on identifying genetic changes that affect disease risk and that are common in the general population. (22) ---- each of these variations slightly increases an individual's risk, having changes in several different genes may combine to increase disease risk significantly. Changes in many genes, each with a small effect, may underlie susceptibility to many common diseases, including cancer, obesity, diabetes, heart disease and mental illness. Researchers are working to gauge an individual's risk (23) ---- developing a common disease based on the combination of variants in many genes across their genome. In people with a genetic predisposition, the risk of disease (24) ---- on multiple factors, not only on an identified genetic change. These include other genetic factors, lifestyle and environmental factors. A person's genetic makeup cannot be altered; (25) ----, some lifestyle and environmental modifications can help to an extent. Having more frequent disease screenings and (26) ---- a healthy weight may be able to reduce disease risk in those with a genetic predisposition.
